

### REVERSE IMAGE SEARCH

Have you ever come across an image online and wondered if, and where, this image may be used or located? TinEye.com can help. Like Google, which is a text-based search engine, TinEye.com is an image search engine that finds the location(s) and/or source of an image.

Here's how it works...locate an image online. Save the image by right clicking on the image. Click on **Save Image As** from the menu list of options, and save it on your desktop or an easy to find location.

Make your way to [www.tineye.com](http://www.tineye.com). Click on the Browse button to find the image on your computer, and that's all you have to do. TinEye.com will immediately go to work, searching its index of images to locate the pages that match your search.

As an example, I uploaded an image of Dwight Schrute from The Office. TinEye.com provided results of the image on 29 sites – one of them being NBC.com, which in this example, would be the source of the image.

It's a great way to not only find the source of an image, but possibly a better image with a higher resolution.
